Policies and Programs for Sustainable Energy Innovations Aug 10 2020 This volume features research and case studies across a variety of industries to showcase technological innovations and policy initiatives designed to promote renewable energy and sustainable economic development. The first section focuses on policies for the adoption of renewable energy technologies, the second section covers the evaluation of energy efficiency programs and the final section provides evaluations of energy technology innovations. Environmental concerns, energy availability and political pressure have prompted governments to look for alternative energy resources that can minimize the undesirable effects for current energy systems. For example, shifting away from the conventional fuel resources and increasing the percentage of electricity generated from renewable resources, such as solar and wind power, is an opportunity to guarantee lower CO2 emissions and to create better economic opportunities for citizens in the long run. Including discussions of such of timely topics and issues as global warming, bio-fuels and nuclear energy, the editors and contributors to this book provide a wealth of insights and recommendations for sustainable energy innovations.

A Handbook on Low-Energy Buildings and District-Energy Systems May 19 2021 Winner of Choice Magazine - Outstanding Academic Titles for 2007 Buildings account for over one third of global energy use and associated greenhouse gas emissions worldwide. Reducing energy use by buildings is therefore an essential part of any strategy to reduce greenhouse gas emissions, and thereby lessen the likelihood of potentially catastrophic climate change. Bringing together a wealth of hard-to-obtain information on energy use and energy efficiency in buildings at a level which can be easily digested and applied, Danny Harvey offers a comprehensive, objective and critical sourcebook on low-energy buildings. Topics covered include: thermal envelopes, heating, cooling, heat pumps, HVAC systems, hot water, lighting, solar energy, appliances and office equipment, embodied energy, buildings as systems and community-integrated energy systems (cogeneration, district heating, and district cooling). The book includes exemplary buildings and techniques from North America, Europe and Asia, and combines a broad, holistic perspective with technical detail in an accessible and insightful manner.

Regenerative Design for Sustainable Development Apr 17 2021 Landscape Architecture Regenerative Design for Sustainable Development Winner, 1994 Merit Award for Communications, American Society of Landscape Architects "Regenerative Design for Sustainable Development is nothing less than a user's manual for planet Earth that integrates the principles of ecological design with practical realities better than anything I've read. John Lyle has written the best book now available on the theory and practice of sustainability . . . essential reading for natural resource professionals, architects, planners, educators, environmentalists, and the general public."--David W. Orr, Professor and Chair Environmental Studies Program, Oberlin College. "John Lyle has written a splendid book, Regenerative Design for Sustainable Development. It is perfectly topical; it is committed to the unity of art and science, design and planning, man and nature. It is itself exemplary, and it is a repository of exemplary adaptations. It has carried the environmental movement to a new threshold of ecological planning and design. It should be widely read and employed." --Ian L. McHarg, FASLA. disruption, the cogent thoughts of John Tillman Lyle on sustainable cities are on target and highly constructive. They are must reading for planning professionals and all concerned citizens." --John Ormsbee Simonds, FASLA. "More designers need to broaden their horizons in the way John Lyle has put forth in this book. In general, there are far too few landscape planners, landscape architects, or architects who have any working procedure that approximates what sustainable design entails. This book provides important historical background and contemporary experience to help guide the way."--Pliny Fisk III, Center for Maximum Potential Building Systems. From the despoliation of our rivers and lakes by industrial runoff to the destruction of our atmosphere by sulphur emissions and CFCs, production cycles based on a one-way flow of materials and energy have pushed us to the brink of environmental collapse. It is time for a change, and in this groundbreaking book, John Tillman Lyle offers us a blueprint for implementing that change. This book provides civil engineers, architects, landscape development planners, and others with practical, realistic approaches to reversing this deadly course. Throughout, the emphasis is on proven regenerative practices for water use, land use, energy use, and building design. Most importantly, it provides ways to reestablish connections between people and nature, between art and science, and between technology and daily life.

efficiency. Methods to reach that end include energy labeling, energy efficiency standards and market conditioning (e.g, energy efficient procurement and DSM programs). Energy efficiency standards, which started out as an action to reduce demand for energy in individual countries, has now become a subject of regional and even worldwide dimension, particularly in the context of global climate change mitigation. Mandatory energy efficiency standards are in place for some appliances in China, Canada, Mexico, the Philippines and the United States. Standards for refrigerator/freezers will take effect in Australia and the European Union in 1999. Voluntary energy efficiency standards are in place for refrigerators in Brazil, India and Korea and for air conditioners in India, Japan and Korea. Table I showed potential global energy use reductions from codes and standards in buildings. If individual country data can be assembled, a more accurate approach to estimating potential reductions in energy use and carbon emissions would be to perform a bottom-up analysis for energy using equipment on an end-use basis in as many large developing countries as possible. The impact of standards would be assessed as more efficient appliances replaced existing stock models and new purchases that increased saturation rates were made at higher efficiencies than would otherwise be the case. This approach would show the slow but steady buildup of annual energy savings from efficiency standards or other programs to improve energy efficiency.
